

IAM Admin API Performance Report (Successful Requests Only)

Overview

This document captures successful admin-side API interactions for the IAM system. It is used for performance baseline tracking and optimization planning.

Environment: Local Development

Base URL: http://localhost:8080

Date: 17 June 2026

Scope: Admin APIs (HTTP 200 / 201 only)

1. Authentication

Login

Endpoint	Method	Status	Response Time
/api/v1/auth/login	POST	200	1515 ms

Observation:

- Primary latency hotspot.
 - Likely involves DB lookup + password verification + JWT generation.
-

2. Admin User Management

Active Users

Endpoint	Method	Status	Response Time
/api/v1/admin/users/active	GET	200	97 ms

Observation:

- Efficient query execution.
-

User Status Update

Endpoint	Method	Status	Response Time
/api/v1/admin/user/1/status	PATCH	200	77 ms
/api/v1/admin/user/1/status	PATCH	200	54 ms

Observation:

- Fast update operations.
 - Slight variation likely due to DB/cache warm-up.
-

3. Admin Profile

Get Profile

Endpoint	Method	Status	Response Time
/api/v1/admin/me	GET	200	51 ms

Update Profile

Endpoint	Method	Status	Response Time
/api/v1/admin/me/update	PATCH	200	38 ms
/api/v1/admin/me/update	PATCH	200	54 ms

Observation:

- Stable low-latency updates.
 - Minor variation expected in local runs.
-

4. Role Management

Add Role

Endpoint	Method	Status	Response Time
/api/v1/admin/role/add	POST	201	60 ms
/api/v1/admin/role/add	POST	201	886 ms

Observation:

- Inconsistent performance.
 - One outlier suggests potential logging / DB / transaction delay.
-

5. Logs & Auditing

View Logs

Endpoint	Method	Status	Response Time
/api/v1/admin/logs/viewall	GET	200	86 ms

Log Downloads

Endpoint	Method	Status	Response Time
/api/v1/admin/my-logs/download	GET	200	886 ms
/api/v1/admin/all-logs/download	GET	200	197 ms

6. Admin Self Data

Get Admin Info

Endpoint	Method	Status	Response Time
/api/v1/admin/me	GET	200	51 ms

Profile Download

Endpoint	Method	Status	Response Time
/api/v1/admin/me/profile/download	GET	200	39 ms
/api/v1/admin/me/profile/download	GET	200	30 ms

7. System Stats

Stats API

Endpoint	Method	Status	Response Time
/api/v1/admin/stats	GET	200	49 ms

Summary Metrics

Metric	Value
Fastest Endpoint	30 ms
Slowest Endpoint	1515 ms
Average Response Time	~210 ms
Success Rate	100%

Key Insights

1. Authentication bottleneck confirmed

Login is significantly slower than all other operations.

2. Log/download operations are moderately heavy

Suggests file generation or DB aggregation cost.

3. Role creation shows inconsistency

One spike indicates possible transactional or logging overhead.

4. Core admin CRUD is stable

Most endpoints are consistently under 100 ms.

Optimization Priorities

1. Authentication pipeline (highest impact)
2. Log generation/download performance
3. Investigate role creation latency spike

4. Optional caching for stats endpoint

Notes

- Data collected from local development environment.
- Used as baseline for future optimization comparison.
- Not representative of production load behavior.
